

Installing CentOS Virtual Machine

Follow the instructions below step by step to install CentOS 6.7 on a virtual machine:

1. Download and install **VirtualBox** from:

<https://www.virtualbox.org/>

2. Download the following OVA file (~ 1.2 GB in size):

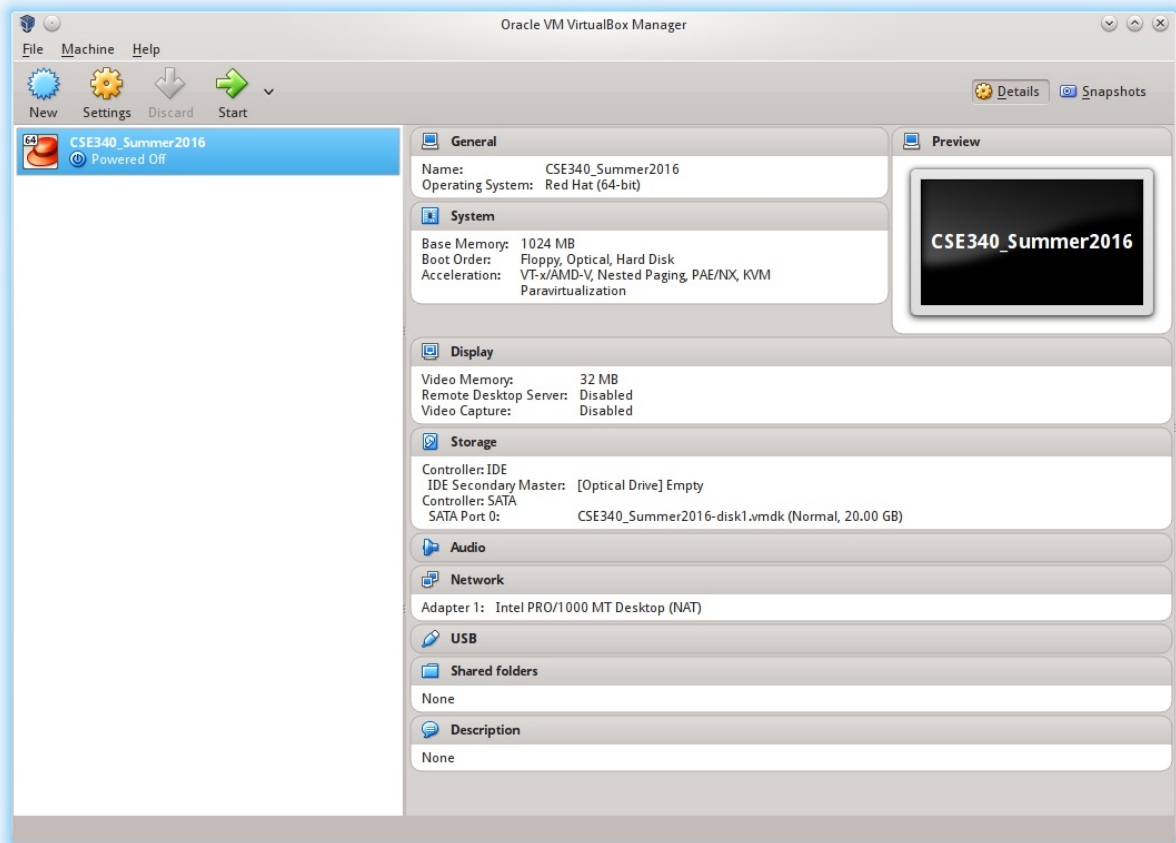

https://www.dropbox.com/s/ar5r0c08q3rh6ei/CSE340_Summer2016.ova?dl=0

3. Start VirtualBox

4. Import the OVA file you downloaded earlier into VirtualBox:

- From **File** menu, choose **Import Appliance**
- In the Import Appliance dialog, choose the OVA file
- Follow the wizard steps and import the virtual machine. The operation can take a few minutes

5. Verify that you have a new entry in the main VirtualBox window, it should look something like this:

- Now you can run the virtual machine any time by clicking on the **Start** button. After you start the virtual machine you will be prompted to login to CentOS, use the following one-time password to login:

cse340rocks

It will then force you to choose a new password. Follow the instructions and choose a new password. Note that it won't let you use the same password nor choose a weak password like **1234**.

In the future, whenever you start the virtual machine, you would login using your own password.

- Start using CentOS for [developing] and testing all your CSE340 projects!

The GCC compiler, Firefox browser and few other utilities are pre-installed so you can use the VM out of the box.

Check out the **README** file on the Desktop and also the **README.pdf** file in **~/cse340/tools** folder.
